MONTHLY RECEIPTS FROM THE SALE OF PRINCIPAL FARM PRODUCTS, BY STATES,
WITH RENTAL AND BENEFIT PAYMENTS, JANUARY 1929 TO DECEMBER 1934 1/

May 1935

Prepared by
C. M. Purves, and Nathan Koffsky,
for the Committee on Monthly Farm Income
of the Bureau of Agricultural Economics;
O. C. Stine, Chairman, C. M. Purves, Secretary,
J. A. Becker, S. W. Mendum, and C. L. Harlan.

Estimates of monthly receipts of farmers from the sale of principal farm products have been prepared for each state for the period January 1929 to December 1934. These estimates of monthly receipts from farm marketings include income from 33 of the more important farm commodities. Among these 33 commodities truck crops have been grouped and treated as one commodity but truck crops include 21 different farm products sold by farmers. The income from the 33 commodities in 1932 amounted to 94 percent of the total income from the sale of farm products. In some states as much as 99 percent of the income from farm production was obtained from the sale of these 33 commodities. In every state cash receipts from these commodities were over 80 percent of the total cash income for the year from the sale of farm products, the lowest representation being in Massachusetts, only 81 percent.

Commodities Included and Scope of Monthly Estimates

Nearly all of the income from the sale of livestock and livestock products is included in these monthly estimates by states. Data on the sale of horses and mules, mohair and honey are too incomplete to estimate the income received monthly from these products and in states where these items of livestock and livestock products are important sources of income these estimates are that much less than the total. However, in every state 95 percent or more of the annual cash income from livestock and livestock products is obtained from the commodities included in the monthly estimates.

The lack of adequate data on marketings and prices of some of the minor crops has prevented including them in the monthly estimates of receipts from the sale of crops. There are many minor crops which are unimportant in the national estimates of farm income but are important sources of income in some of the states. For all states the cash receipts

1/ The Division of Finance and Research of the Farm Credit Administration did much preliminary work and contributed materially in preparing these estimates and providing the basis for a continuous service.

from crops included in these monthly estimates were 87 percent of the total cash income from crops in 1932. In some of the more important agricultural states receipts from the commodities included amounted to 95 percent or more of the total annual income from the sale of crops in 1932, but in some of the New England States where greenhouse products, nursery products, and forest products are an important source of farm income, the proportion of total income from crops represented by these commodities was below 50 percent. In Vermont maple sugar and forest products are both important sources of income to farmers so that the commodities included in these estimates made up only 43 percent of the total cash income from the sale of crops. Table 1 gives the percentage of total cash income obtained from the crop and livestock items included in the monthly state estimates of cash receipts based upon income from 1932 production and also lists the crops for each state which are not included in the income estimates, but are an important source of farm income.

In preparing these monthly estimates of cash receipts by states several problems have arisen which bring out the need for additional information regarding farm marketing and prices. Plans are being made to add to the present information on farm marketing and prices so that the monthly estimates of cash receipts by states can be brought into closer agreement with the annual estimates of cash income from farm production by states. Certain refinements also need to be made to make the monthly estimates of cash receipts more useful. Additional research is to be carried on to improve these monthly estimates, and when revised estimates are available they will replace these estimates now being released. Consequently, these estimates should be considered as preliminary, but they have been released at this time in order to provide a rough measure of current economic changes by states until the additional refinements can be made.

As income from the sale of farm products in many states is highly seasonal it is difficult to determine whether the fluctuations in cash receipts are the result of seasonal variation in marketings or the result of improving or declining market conditions for farm products. Consequently, adjustments for this seasonal variation in income would facilitate monthly comparisons of farm receipts. There are several factors, however, which give rise to difficulty in making a seasonal adjustment of these monthly estimates of cash receipts by states. In those states where only a moderate proportion of the total income from crops is represented by the 33 commodities included in the estimates it is quite probable that the seasonal trend of incomes from the sale of all crops is somewhat different from the income of these commodities, and at present insufficient data are available regarding the monthly income from the remaining crops to allow for this difference in seasonal trend of incomes. While there is a tendency for prices of all farm products to rise and decline together, many of the products not included, such as forest products, greenhouse products, and nursery products, are only indirectly related to other farm products, and it is possible that the advances and declines in income from these commodities may be quite different from that of the more staple farm products. Furthermore, in adjusting for seasonal trend it is necessary to have data for several years. The estimates of monthly receipts by states are available for only 6 years, and conditions have been so unstable during the period that it is difficult to devise a satisfactory normal seasonal

measure of incomes by states. A tentative seasonal measure by regions is presented later in the report.

No adjustment has been made in the monthly receipts from the sale of livestock for the in-shipment of feeder livestock into the principal feeding states. That part of the livestock marketed in any month which was shipped into the state as feeders may have been shipped in anywhere from 30 days to a year previous to the date of sale. In order to compute accurately the income from livestock grown within a state, deductions should be made for the livestock shipped into the state to be fed to heavier weights. In order to do this it would be necessary to know the amount of the livestock marketed during the month which had been shipped into the state and the cost of the livestock at the time it was purchased as feeders. Little data are available by which these adjustments could be made. Hence the total sales of livestock from the principal feeding states are slightly larger than they would be if the estimates represented only the value of livestock produced within the state. Since no adjustment is made for the in-shipment of livestock in the state estimates the sum of the income from the sale of livestock in all states is larger than the United States total of income from the sale of livestock. In some of the principal feeding states the income from the sale of livestock are from 5 to 15 percent higher without this adjustment.

As no adjustment is made in the estimates of income from the sale of crops for those crops for which marketings and prices are not available and no allowance is made for the in-shipment of cattle, these estimates of monthly farm receipts should be considered as the flow of money to farmers in the state from the sale of principal farm products rather than as an estimate of total income from farm marketings. However, inasmuch as a very high percentage of the total income is measured by these monthly estimates of receipts they tend to approximate the monthly income of farmers in the state and furnish a more current measure of the changing economic conditions of farmers in the various states than has heretofore been available.

Method of Computing Monthly Receipts by States

The estimates of income by states are divided into income from crops and income from livestock and livestock products. The crops upon which the income estimates are based are corn, wheat, oats, barley, rye, flaxseed, rice, cotton lint, cottonseed, tobacco, hay, dry edible beans, potatoes, sweet potatoes, apples, pears, citrus fruits (California and Florida only), strawberries, peaches (California and Georgia only), grapes (California only), sugar cane, sugar beets, and truck crops. The items of livestock are cattle, calves, hogs, sheep and lambs, chickens, eggs, wholesale milk, retail milk, butterfat and wool. These commodities have been chosen because they are the most important sources of income in one or more states, farm prices are available monthly and information is available from which estimates of marketings by states can be made. There are other commodities which are a more important source of income in some states than those included, particularly forest, greenhouse and nursery products, and peanuts, but neither satisfactory prices nor marketings are available for these products.

The monthly estimates of cash income are derived from estimated monthly marketings of the several farm commodities by states and the farm price of these commodities. Monthly marketings are estimated from a wide variety of data. In some cases, in which marketings are fairly regular year after year, the average seasonal trend of marketings for each state has been applied to the estimated amount of the commodity which would be sold during the year. This method is used in estimating the sales of whole milk, retail milk, wool, sweet potatoes, pears, sugar beets and cane.

In the case of durable commodities the estimated amounts sold are based upon both production and changes in carry-over. For many of these commodities data are available which measure the amount of the commodity marketed by farmers each month for the country as a whole. These monthly marketings are broken down by states according to production and the average seasonal trend of marketings for each state. Monthly marketings are available for the grains, cotton and cottonseed, tobacco, and most of the fruits and vegetables. An illustration of the method of estimating monthly marketings of wheat is representative of the method used for most of these commodities for which data on monthly marketings are available. At the beginning of each crop marketing seasonal estimates are made of the amount of wheat that will be sold from the present crop in each state. The carry-over at the beginning of the season is added and the estimated carry-over at the end of the season is deducted from the portion of the crop to be sold. The estimates of prospective marketings are based upon the current crop production, the amount of wheat to be used for seed and food, and the estimated amount of wheat which is likely to be fed based upon supplies of other feeds and the relation between wheat prices and prices of other feed grains. After the annual estimates of marketings are determined they are broken down into monthly estimates by applying the average percentage marketed each month in each state during the 5-year period 1928-1932. The sum of marketings in all states for any month is then compared with the estimated actual marketings of wheat during the month. If the actual marketings are found to be different than the estimated marketings based upon the average of seasonal marketings, then the estimated marketings in each state are adjusted until their total equals the total marketings for the country as a whole. This method not only allows for the seasonal variation in marketings but also tends to measure the deviations from the seasonal trend. These estimates of marketings are checked against a variety of data such as inspections or receipts of grain in local markets, car-lot shipments by state of origin, and other data which provide some measure of the fluctuations from month to month in the marketings of farm crops in the various states.

Livestock marketings are based largely upon receipts at the central markets by state of origin. These are checked against inspected slaughter figures, receipts at 62 markets, livestock on farms January 1, the semi-annual pig surveys, and the movement of feeder lambs and cattle into feeding areas. The annual estimates of livestock marketings for previous years are broken down by months according to receipts at the central markets by state of origin. Marketings for current months are then estimated by multiplying the ratio of market receipts in the current month to receipts in the same month of the preceding year by the estimated amount marketed in the preceding year.

The estimated sales of chickens and eggs for past years are computed by applying the monthly seasonal trend of marketings for each state to the estimated annual sales. These monthly trends of marketings by states are computed from eggs laid per farm flock, chickens on farms at the beginning of each month, and market receipts of chickens and eggs. The current estimates of marketings of eggs are made by multiplying the marketings for each state in the corresponding month for last year by the ratio of eggs laid daily per farm flock for each state in the current month as compared with the same month last year. The current estimates of poultry marketings are based on the quarterly change in the number of hens and pullets per farm flock, the change in the average weight per bird in each state, and are checked against total receipts of poultry in the central markets.

The annual sales of milk sold as butterfat and farm butter sold are broken down by months on the basis of estimates of the seasonal trend of creamery butter produced by states, by months. The current estimates of farm butter and farm butterfat sales are computed on the basis of the percentage change in creamery butter production in the more important states and gross receipts of butter at the principal markets. In all cases the prices received for farm products by states are applied to the estimated monthly marketings by states to arrive at the monthly cash receipts from the sale of principal farm products.

While income from the several individual truck crops is a very small proportion of the total United States income, the income is important when truck crops are considered as a group. This is especially true in states specializing in truck crops and also in some months of the year as the sales of truck crops in many states are highly seasonal. In addition to the large number of truck crops, there are many other factors which make it practically impossible to estimate income from individual truck crops. In many states, local sales of truck crops are as important or more important than commercial sales of truck crops and no data are available on the value of local sales by commodities. Consequently, truck crops were treated as one commodity.

The seasonal distribution of income from truck crops by states was derived principally from car-lot shipments and prices of the several truck crops in 1932 and 1933. The total annual income from truck crops was then broken down on the basis of this derived seasonal trend. Currently the income from truck crops for each state is estimated by computing the ratio of the estimated income from truck crops in the United States in the current month this year to the income in the same month last year and multiplying the monthly income estimates by states in the previous year by this ratio.

A comparison of the sum of the cash receipts from the sale of selected farm products for all states and the United States estimates of monthly cash income from the sale of all farm products is given in Tables 2 and 3. A comparison of the income from crops in these two series shows quite a different seasonal for the cash receipts of principal crops than for the total estimated cash income. During the summer months when principal crops are moving to market in volume the receipts from the principal crops are almost as large as the total income from crops, whereas, in the winter months, the receipts from the principal crops are somewhat smaller than the estimated total cash income. The United States estimates

of total cash income from crops are based upon the movement of the principal crops but are adjusted to include income from the sale of other commodities, such as forest products, grass and legume seeds, and other minor crops, for which either monthly prices or marketings are not available. The monthly estimates of receipts from the sale of principal farm products by states have not been adjusted to an income basis because of the lack of sufficient data on the movement of these miscellaneous commodities by states and because of the variation in their relative importance in the total cash receipts of farmers in the different states.

The sum of the receipts from livestock and livestock products by states is based upon the movement of livestock to market or to feed lots from the different states whereas the United States estimate of cash income from livestock is based upon inspected slaughter. As livestock moves from one state to another for feeding and breeding purposes and then later moves to central markets for slaughter, the sum of the state estimates exceeds the United States cash income estimates, especially during the late summer and fall months when livestock is moving to feed lots in volume.

Changes in Cash Receipts by Regions, 1929 to 1934

There have been marked variations in both the extent and the rate of decline and subsequent rise in farm income in the various regions since 1929. With the beginning of the decline in industrial activity and prices in 1929, the farm commodities first affected were those entering into manufacturing such as cotton and wool. Wheat was also affected early in the depression by larger crops and accumulation of stocks. Sizeable inventories of many of these durable farm commodities had been built up before 1929 and prices of some farm commodities began to decline even before the demand for farm products was greatly curtailed by declining consumer purchasing power. In most states where income from these durable crops was a large proportion of the total, such as the Cotton Belt States and some of the states specializing in wheat production, income began to decline in the early part of 1929. As inventories continued to pile up, prices declined further and faster for the durable farm commodities than for most others so that the income from these commodities declined earlier and to a lower level than for all farm products.

Income from livestock and livestock products did not begin to show any appreciable decline until the spring of 1930. Both income from crops and livestock tended upward after the spring of 1933 but the advance in income from crops since the spring of 1933 has been much greater than the advance in income from livestock. Because of the wide variation in the percent of the total income received from the sale of crops in the different regions of the United States this difference in the trend in income from crops and income from livestock has caused marked differences in the extent of the decline and subsequent improvement in income in various regions of the United States. Extended droughts during this period have also caused marked fluctuations in income. The extent of the decline and subsequent recovery in farm income by regions is illustrated by the data in the following table which show annual receipts from the principal farm products as a percent of 1929. Receipts in 1934 are shown both including and excluding rental and benefit payments. The discussion following the table explains the variation in farm receipts by regions from 1929 through 1934.

Total receipts from the sales of principal farm products, by regions,
1929-1934

North Atlantic States

As more than two-thirds of the farm receipts in this region are supplied by receipts from the sale of livestock items, with receipts from milk the heaviest contributor, total receipts in these states were not subjected to as pronounced a decline from 1929 to 1932 as were the receipts for the United States as a whole. After declining to about 54 percent of the 1929 level in 1932, total receipts in this region had recovered by 1934 to about 66 percent of the receipts in the peak year, with but little dispersion from this average among the several states. Although farmers' receipts in this area increased less from 1932 to 1934 than in any other region, income in 1934 was higher, relative to 1929, than in any area except the South Atlantic States. The advance in receipts during 1934 was somewhat retarded during the later months of the year by the very low price of potatoes for the current crop and receipts in Maine since August 1934 have been smaller than in the corresponding months a year previous. However, the improvement in prices, especially of livestock products, in this period have been sufficient to offset the decline in receipts from potatoes for the region. Rental and benefit payments to farmers have not been an important source of income in this area.

East North Central States

Changes in receipts in this region, since 1929, corresponded closely, but at a slightly higher level, with the changes for the United States as a whole. Total receipts in 1932 had declined to about 44 percent of the receipts in 1929, with receipts from crops at 39 percent and receipts from livestock items at 46 percent of 1929. Receipts in Illinois and Wisconsin had fallen to 42 percent of the peak year. Receipts from crops rose considerably as grain prices improved during the next 2 years and were materially increased in the last half of 1934 as the very short production of these grains in the drought areas was reflected in substantial price increases. Somewhat smaller production of corn and wheat in the

East North Central States was more than offset by higher prices, and receipts from crops in 1934 were at about 59 percent of the 1929 level. Considerable improvement in the prices of livestock products, especially of dairy products and eggs, increased receipts from these sources and when rental and benefit payments in 1934 are included total receipts in this region were at 59 percent of receipts in 1929. Receipts in Indiana and Michigan had recovered to 63 percent of the 1929 level.

West North Central States

Receipts in the West North Central States have been adversely affected by drought in several of the past 6 years and declined more severely from 1929 to 1932 than in any other region in the United States. In 1932, following the drought of 1931, receipts were only about 36 percent of the 1929 level. Not only has production been reduced in this area but, being a surplus producing area some distance from the central markets, farm prices declined to a greater extent than in most other areas. In 1932 farm prices for grains had been reduced to a level approximately one-third that of 1929 and receipts from crops were less than one-fourth of that of 1929. The farm price of cattle for the region declined from 10.4 cents per pound in 1929 to 4.6 cents per pound in 1932, while the reduction in hog prices was even more marked, falling from 9.3 cents per pound in 1929 to 3.2 cents per pound in 1932. These marked price declines together with some decline in production reduced receipts from livestock and livestock products in 1932 to 40 percent of that of 1929. In North and South Dakota where droughts have been the most severe and persistent during the past 6 years receipts in 1932 were only 26 and 25 percent respectively of the receipts in these states in 1929.

In 1933 drought continued to restrict production in this region. The improvement in income was less marked than in most other regions and was still lower relative to 1929 than in any other region. The drought of 1934 also was most severe in this area and the production of grains was sharply curtailed. Heavier marketings of grains in the first half of the 1934-35 season than would normally occur from these very short crops, together with the great improvement in the prices of these commodities maintained the receipts from crops in the latter half of 1934. Improved prices for livestock items combined with considerable distress selling of cattle in this area through commercial channels, in addition to the extensive cattle purchases by the government in the last half of 1934, resulted in a recovery in receipts from livestock products. The most serious crop failure occurred in North and South Dakota. Receipts from farm marketings in these states in 1934 were only about one-fourth as large as those received in 1929, and were even smaller than the very low receipts in 1932. Practically complete crop failure in South Dakota forced receipts from crops in this state to only 3 percent of the receipts from this source in 1929. Despite a huge cattle purchasing program conducted by the government in this area, a large amount of distress selling of cattle through regular channels took place and helped to prevent the receipts in these states from declining more severely. However, income from this source cannot be considered wholly, a net gain to the farmer as they have been accompanied by marked reductions in livestock inventories. Large government payments on the various crop control programs and for the purchase of surplus livestock were received

in 1934 by farmers in these states and were of sufficient importance to raise total receipts in North and South Dakota to 43 percent and 35 percent, respectively, of the high 1929 level.

South Atlantic States

The decline in receipts in this area from 1929 to 1932 was very similar to that for the entire United States. By 1932, total receipts in this region had declined to 42 percent of the 1929 level, with receipts from crops at 39 percent and receipts from livestock at 52 percent of the receipts in that year. Receipts in Georgia and South Carolina in 1932 had fallen to 30 percent and 37 percent respectively of the peak year due largely to the steady decline in the farm price of cotton since 1929. The much lower farm price of tobacco was mainly responsible for a reduction in receipts in North Carolina to 38 percent in 1932. The bottom of the decline in receipts in Delaware, West Virginia, and Florida was reached in 1933, primarily due to low milk prices in the first state, sharply reduced production of apples in the second, and the very low price of oranges in the third.

By 1934, prices of farm commodities had improved considerably and the regional receipts from farm marketings in 1934 had recovered to 67 percent of the 1929 level. Receipts from crops were 70 percent and receipts from livestock products 58 percent of the receipts in the peak year. When rental and benefit payments are included income in this area was higher, relative to 1929, than in any other region and was 71 percent of 1929. In general, the advance in receipts was most marked in those states where receipts from crops provide a large share of the total receipts. Total receipts in North Carolina in 1934 were 97 percent of the receipts in 1929, due in most part to the large increase in tobacco prices and, to a smaller degree, to the rental and benefit payments received by farmers in this state.

South Central States

Because of the importance of income from cotton in this area farm income declined much more rapidly than in other regions in 1930 and 1931 and reached almost as low a level in 1932 as income in the West North Central States. From 1932 to 1933 receipts from the sale of farm products showed a larger increase in this area than in any other area but the small production due to drought in 1934 resulted in a slight decline in income while income in all other regions increased. Receipts, excluding rental and benefit payments, in 1934 were less than half the receipts in 1929. Very substantial government payments raised the position of total receipts in 1934 to 55 percent of the 1929 level.

Farmers in this area depend largely upon crops to supply most of their income. Production of cotton was sharply reduced in Oklahoma and Texas in 1934, largely due to the drought in that year, and receipts from crops in these states were smaller than in 1933. Government payments in Oklahoma and Texas in 1934 amounted to almost one-fifth of the total receipts from the sale of farm products and supported total receipts at 45 percent of the 1929 level in Oklahoma and at 58 percent in Texas.

Western States

Receipts for the region as a whole had declined in 1932 to 43 percent of the 1929 level, and receipts in the Mountain States fell sharply below this average. Receipts in Montana and Nevada were only 31 percent of 1929. Receipts in California, which amounts to almost one-half of that of the entire region, were maintained at 51 percent of the receipts in this state in 1929.

Receipts from all sources in 1934 were 57 percent as large as the receipts in 1929. While there was a considerable advance in receipts due to improvement in prices, a substantial part of the gain, especially in the Mountain States, was due to payments for livestock sold to the Agricultural Adjustment Administration by farmers in 1934. Receipts from marketings in New Mexico in 1934 were but slightly improved relative to 1932, due primarily to smaller marketings of cattle from this state through commercial channels. Even after government payments in 1934 are considered Colorado and Nevada had less than one-half as large receipts as in 1929. Improvement in receipts from a variety of commodities in California supported receipts in this state at 62 percent of the 1929 level.

Seasonal Trends in Cash Receipts from Principal Farm Products, by Regions

Adjustment for seasonal variation in the estimates of cash receipts by states would greatly facilitate comparisons of month-to-month changes in farm receipts. However the shortness of the period for which these estimates are available together with the marked decline and subsequent advance in income during the period and the irregularity of income due to droughts make it impracticable to determine a measure of the seasonal variation in income for each state from the data now available. For these reasons, only a rough approximation of the seasonal trend of receipts in the various regions of the United States is indicated. These tentative seasonal trends by regions have been computed largely from the monthly receipts in 1929, 1930 and 1934, as the trend of marketings in these years appeared more nearly normal and the downward trend in 1930 was about offset by the upward trend in 1934. The seasonal trend of cash receipts were determined from the percent that each months receipts were of the monthly average for the year. The percentage for the same month for each of the 3 years mentioned above were averaged and these averages have been rounded to exclude fluctuations due to the small number of years considered. The shortness of the period and the abnormality of the marketing condition in these years greatly limits the use of these measures of seasonal variation in marketings. As monthly estimates become available for a longer period these seasonal trends can be improved upon, and the seasonal trend of total receipts and of receipts from crop and receipts from livestock and livestock products given in the following table should be considered as tentative and only as rough approximations. Since these trends are based upon receipts from thirty-three of the more important farm commodities it is possible that total income from marketings may have a slightly different seasonal trend than that indicated in the following tables. It is not likely, however, that the seasonal trend would be much different from those indicated except possibly in the New England States where a relatively large proportion of receipts are obtained from the sale of forest products, maple sugar and cranberries for which no monthly data are available. As these

products are marketed largely in the winter and early spring months it is possible that the proportion of income received from crops in the months from November to May in this area is slightly larger than that indicated in the following table.

Seasonal variation in cash receipts from 33 principal farm products,
by regions

The seasonal variation in cash receipts in the different regions differs considerably depending upon the principal sources of income of farmers in the regions. In the North Atlantic States the receipts from the sale of farm products are fairly regular from month-to-month, varying from 87 percent of the yearly average in December to 114 percent in September. The seasonal variation in income from crops is somewhat more marked than, and somewhat different from, the seasonal variation in income from livestock, but since a large proportion of the total receipts comes from livestock the fluctuations in income from crops do not seriously affect the total. The predominance of livestock in the total income in the East North Central States tends to stabilize monthly receipts in this area. For the 33 commodities considered the receipts vary from 92 percent of the monthly average for the year in April to 115 percent in August when marketings of wheat are relatively large. The seasonal trend of receipts in the West North Central States is very similar to that of the East North Central States.

In the South Atlantic and South Central States where a large proportion of the total income is obtained from the sale of crops the seasonal variation in monthly receipts is much more pronounced. The low point in receipts in this area usually comes in April and May and the high point in October when marketings of cotton usually reach their peak. In the South Atlantic States receipts vary from 72 percent to 190 percent of the monthly average for the year and in the South Central States the variation is from 66 percent to 204 percent of the average for the year. In the Western States the seasonal variation in the different areas is wide, due to the variation in commodities produced in different areas. In most of the regions, however, the low point of receipts occurs in the spring months, February and March, and the peak of receipts occurs from September to November when marketings of livestock, grapes, and wheat in this area are unusually heavy.

Monthly Receipts by States and Regions

The estimates of income by states and by months from January 1929 to December 1934 are given in the tables from pages . The estimates have been subdivided into income from crops and income from livestock and livestock products. In addition, rental and benefit payments by months and by states are shown since August 1933 when the first payments were made. In the future, estimates of cash receipts of farmers by states will be made each month by the Bureau of Agricultural Economics as soon as marketing and price data are available for the month. Additional income in the form of rental and benefit payments received by farmers each month will also be reported by states.
